8 Days of EchoKey — Day 7: Diagonality (XYZ)

Layout–Aware ZYZ Euler Synthesis

EchoKey Team (CC0)

September 12, 2025

Abstract

This Day 7 note introduces the *Diagonality (XYZ)* generator in the EchoKey 7–operator frame and derives a layout–aware compiler rewrite to native ZYZ Euler rotations. The symbolic gate ek_diagxyz(θ) = $e^{-i\theta(\mathbf{a}_7\cdot\boldsymbol{\sigma})}$ rotates by physical angle 2θ about the body–diagonal axis $\mathbf{a}_7 \propto (1,1,1)$. We state the rule, argue correctness up to global phase, record the verification metric, and summarize implementation details used in the examples.

1 Background and Notation

Let $\boldsymbol{\sigma} = (\sigma_x, \sigma_y, \sigma_z)$ be the Pauli vector, and let $\mathbf{A} \in \mathbb{R}^{7\times 3}$ be the EchoKey frame whose unit–norm rows are $\mathbf{a}_k^\top$. As in earlier days, define traceless local generators

$$E_k^\circ := \mathbf{a}_k \cdot \boldsymbol{\sigma}, \qquad k = 1, \ldots, 7. \tag{1}$$

We use 1–based indexing in the prose ($\mathbf{a}_7$ here corresponds to code index 6).

Day 7 choice (Diagonality XYZ). Select the body diagonal

$$\mathbf{a}_7 \propto (1,1,1), \qquad \|\mathbf{a}_7\| = 1. \tag{2}$$

The Day 7 gate is

$$\text{ek\_diagxyz}(\theta) \stackrel{\text{def}}{=} e^{-i\theta\,(\mathbf{a}_7\cdot\boldsymbol{\sigma})}. \tag{3}$$

This completes the seven canonical directions: the three axes (X,Y,Z), the three plane diagonals (XY,YZ,XZ), and the body diagonal (XYZ). The set improves geometric coverage and provides well–conditioned site frames for the emergence construction.

2 Axis–Angle Form

Every $U \in \mathrm{SU}(2)$ admits the axis–angle representation

$$U(\varphi, \hat{\mathbf{n}}) = \cos\frac{\varphi}{2}\,\mathbb{I} - i\sin\frac{\varphi}{2}\,(\hat{\mathbf{n}}\cdot\boldsymbol{\sigma}), \qquad \hat{\mathbf{n}} \in \mathbb{S}^2. \tag{4}$$

Matching (3) to (4) yields

$$\hat{\mathbf{n}} = \mathbf{a}_7, \qquad \varphi = 2\theta. \tag{5}$$

Thus ek_diagxyz(θ) is a Bloch rotation about the body–diagonal axis.

3 ZYZ Euler Decomposition

Any single–qubit unitary is (up to a global phase) a ZYZ product,

$$U \doteq \mathrm{RZ}(\alpha)\,\mathrm{RY}(\beta)\,\mathrm{RZ}(\gamma). \tag{6}$$

We form the exact 2×2 matrix $U(2\theta, \mathbf{a}_7)$ via (4) and decompose it to obtain Euler angles (α, β, γ), giving the substitution

$$\text{ek\_diagxyz}(\theta) \doteq \mathrm{RZ}(\alpha(\theta))\,\mathrm{RY}(\beta(\theta))\,\mathrm{RZ}(\gamma(\theta)). \tag{7}$$

There is no special one–gate fast path here; we always synthesize ZYZ exactly.

4 Layout–Aware Axis Resolution

Let phys : {logical wires} $\to \{0, \ldots, n-1\}$ be the placement mapping. Each physical wire p has a local frame $\mathbf{A}^{(p)}$. When rewriting a gate on logical wire q, use

$$\boxed{\hat{\mathbf{n}} = \mathbf{a}_7^{(\,\mathrm{phys}(q)\,)}, \qquad \varphi = 2\theta.} \tag{8}$$

Run the pass *after* placement, or provide the final layout in the pass property set.

5 Correctness

For each gate occurrence, compute $U(2\theta, \hat{\mathbf{n}})$ from (8) and factor it as in (6). ZYZ covers all of SU(2) up to a phase, so the substitution (7) preserves the circuit unitary up to a global phase. Composing locally over the DAG preserves the total unitary.

6 Validation Metric

We compare the materialized input unitary (symbolic echo gates replaced by exact 2×2 matrices) and the output unitary (after the pass) using the phase–insensitive overlap

$$\mathcal{F}(U_{\mathrm{in}}, U_{\mathrm{out}}) = \frac{\left|\mathrm{Tr}\left(U_{\mathrm{in}}^{\dagger} U_{\mathrm{out}}\right)\right|}{2^n} \in [0, 1]. \tag{9}$$

Exact synthesis yields $\mathcal{F} \approx 1.000\,000\,000\,000$ across the included examples.

7 Worked Examples

Ex 1: 1q simple: ek_diagxyz(0.40) then H. With $\mathbf{a}_7 = (1, 1, 1)/\sqrt{3}$ the pass emits a native ZYZ triple.

Ex 2: 1q sequence: $\mathrm{RX}(0.11)$ ek_diagxyz$(-0.42)\,\mathrm{RY}(0.23)$ ek_diagxyz$(0.80)\,\mathrm{RZ}(-0.31)$. Each echo gate rewrites independently.

Ex 3: 2q with entangler: H_0 ek_diagxyz$^{(0)}(0.50)\,\mathrm{CX}_{0\to1}$ ek_diagxyz$^{(1)}(-0.25)\,\mathrm{RY}^{(1)}(0.40)$. Per–wire frames may tilt the body diagonal; the pass uses (8).

Ex 4: Multi–qubit per–site frames: assign distinct $\mathbf{A}^{(p)}$ and tilt every second $\mathbf{a}_7^{(p)}$ slightly toward $+X$ to ensure the general path is exercised; add nearest–neighbor CNOTs.

8 Edge Cases and Numerics

- **Degenerate/NaN axis:** if $\|\mathbf{a}_7\| \approx 0$ or contains NaNs, reject the gate.
- **Branch cuts:** Euler angles are not unique; any consistent branch yields phase–equivalent unitaries.
- **Ordering:** run the rewrite after placement so (8) uses *physical* indices.

Complexity. Linear in the number of ek_diagxyz gates; each ZYZ synthesis is $\mathcal{O}(1)$ for 2×2 matrices.

9 Code–Math Correspondence

- `EchoKeyDiagonalityXYZGate` and `EchoKeyDiagonalityXYZRewritePass` implement (3) and the ZYZ substitution (7).
- `site_specific_A` provides per–wire frames $\mathbf{A}^{(p)}$ used by (8).
- `materialize_ek_ops` builds the ground–truth unitary $U(2\theta, \hat{\mathbf{n}})$.
- `compile_with_pass_only` runs the pass without routing and compares fidelities.
- `ex1..ex5` mirror the worked examples above.

10 Repro Checklist

1. Choose per–wire frames $\{\mathbf{A}^{(p)}\}_{p=0}^{n-1}$ with unit rows; set $\mathbf{a}_7^{(p)}$.
2. Build the circuit with symbolic ek_diagxyz(θ) gates.
3. Resolve $\hat{\mathbf{n}} = \mathbf{a}_7^{(\mathrm{phys}(q))}$ and $\varphi = 2\theta$ for each gate.
4. Materialize $U(2\theta, \hat{\mathbf{n}})$ and decompose to ZYZ; replace each echo gate by RZ RY RZ.
5. Validate with the fidelity metric; expect $\mathcal{F} \approx 1$.
